scientists have been playing a fantastic game rocketing a capsule around the earth and then sending up airplanes to snare it on the fly like inter**planetary ou**tfielders. Up to now, success has been rare. But Discoverer is blazing an important trail into space.

By RALPH DIGHTON YANDENBERG AIR FORCE BASE, Calif. (AP)—It's time for a

hard look at the hard luck Discoverer, workhorse of America's satellites. After a dozen more or less thorough failures, two successive launches

scored two firsts in space exploration, only to be topped days later by a spectacular show of Russian strength, Discoverer XIII aimed a capsule at earth with enough accuracy for it to be fished from

the ocean somewhere close to its 60-by-200-mile target area. This was the first recovery of an object from orbit.

Discoveror XIV's capsule was caught in the air by planes, the first aerial recovery of an object from orbit.

Two days later the Russians claimed they had recovered a capsule containing live, unhurt, animals, and, even more, the satellite itself.

Recovery of animals from orbit has yet to be achieved by a Discoverer. The first try, with mice, ended in blazing failure when a second-stage shot back into the atmosphere instead of into orbit. The next try, with a Rhesus monkey, is scheduled for later this year.

SINCE THE SPACE firsts scored by Discoveries XIII and XIV, Discoverer XV has been placed in orbit, Its capsule missed the recovery area near Hawaii by nearly 1,000 miles, but, thanks to slick electronic sleuthing, was spotted bobbing in the lonely Pacific. A storm came up, however, and prevented recovery.

The Russian shot topped Discoverer's best in two other significant ways: Not only did they get the satellite itself back from orbit, they reportedly recovered both the spaceship and onstrated so far by Americans.

future Discoverers.

"Once we perfect the reliabil-Ity of our recovery technique," will try to drop capsules so they live in his home.

chance of damage or injury if from being drafted under the circumstances?"

No. Continue to pay them ustill at strategic locations on the state the VA tells you your application road system.

develop vehicles for various jobs called Agena B, boosted by the in space.

3. Probably the most urgent of these jobs is spying on an unpredictable, unco-operative neighbor, Russia, in order to strengthen national defense.

4. At least 20 more Discoverer shots are planned and more may be added if necessary,

5. Some of them may be sent around the moon and back seeking military information not likely to be obtained by such purely scientific vehicles as the upcoming Ranger rockets. A 'pure scientist," for instance, might want only to know what the moon is made of, A military man wouldn't care if it were made of green cheese, so long as the cheese were hard enough to shield him from attack and withstand the blast of rocket landings and launchings.

AIR FORCE strategists believe Discoverer, despite its widely publicized failures, has been extremely successful. It way for America's upcoming "sky spy" satellites, Midas and

Midas is designed to detect, with infrared sensors, the hot exhausts of missiles launched anywhere in the world, Samos will carry cameras, and eventually television equipment, to photograph potential target areas with techniques far superior to those used by the U2 plane shot down by the Soviets.

Before this vital equipment can be placed in the sky, a vehicle had to be built to carry it there, Discoverer shots are helping perfect the vehicle.

The orbiting part of the Thorboosted Discoverer is the Lockheed-built second stage, called Agena. Midas and Samos satellites will be an improved model,

Convair-built Atlas missile. Some of the information to be obtained by Midas and Samos sensors will be too detailed-and too secret-to be sent back to earth by radio. Capsule drops of tapes and films are an obvious answer. If these drops can be made near big land bases, as planned, the chances of interception are reduced.

THE SPECTACULAR air catch of Discoverer XIV's capsule-by a C119 which managed to drape the parachute over a huge trapeze and reel it inalso shows the way human spies could be ferried back to earth. Air force technologists say a Ci30 could easily catch a 3,000pound manned capsule like that soon to be rocketed aloft as a part of project Mercury.

Successful recovery of a complete satellite, as planned, has vital applications for Project Dynasoar, a vehicle that will be able to glide down from orbit has done at least one key job it and land like a plane. Discoverwas supposed to do: pave the ers may never have wings, but their capsules are solving some of Dynasoar's atmospheric reentry problems.

> One question Discoverer critics are beginning to ask is this: With Midas and Samos so near - they're due to begin going aloft from the West Coast early next year - why continue with Doscoverer?

A high placed source answers it this way:

No one knows how Russia is going to react to the presence of Midas and Samos in the skies. She may match them with similar satellites of her own. or she may elect to try to knock ours down.

In either case it would be wise to know what is inside future Russian satellites.
